DETAILED ACTION

Allowable Subject Matter

Claims 1--28 are allowed.

The following is an examiner's statement of reasons for allowance:

Prior art does not teach a method of inhibiting metal silicide encroachment in a transistor, wherein implanting encroachment inhibiting ions into the transistor after selectively removing the unsilicided portions of the metal layer;

Maa (US 6,218,249 B1) teach process of forming silicide at uniform rates across the entire source/drain region. A two-step annealing method is used. A first, low temperature anneal begins the salicidation process across the source/drain electrode surface. The annealing is interrupted to remove excess silicidation metal. However, Maa does not teach a method of inhibiting metal silicide encroachment in a transistor, wherein implanting encroachment inhibiting ions into the transistor;

Havemann (US 4,788,160) teach process for forming silicided junctions wherein the titanium is reacted with exposed silicon regions and to form silicide layers and then dopant impurities are implanted into the substrate prior to stripping the unreacted titanium.

Yang (US 6,096,647) teach deposited a cobalt layer subjected to a first rapid thermal process whereby the cobalt is transformed to cobalt monosilicide. The unreacted cobalt layer is removed. A dielectric layer is deposited overlying the substrate and the cobalt monosilicide layer. The substrate is subjected to a second rapid thermal process whereby the cobalt monosilicide is transformed to cobalt disilicide.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

Conclusion

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Ha (US 6,319,785 B1); Joshi (US 5,084,417) and Iwata (US 6,297,114 B1) teach deposition of a refractory metal on a silicon substrate utilizing high temperature and a silane reduction process.
